Nucleic acids encoding nicotinic acetylcholine receptor sub-units used in screening to determine the effect of drugs on the receptor lisclosure; Page 71-73; 108pp; English.

A DNA sequence (T48239) codes for the alpha-7 subunit (W09025) of the human neuronal nicotinic acetylcholine receptor (nAChR). Host cells, esp. mammalian cells or amphibian occytes, carrying alpha-7 nucleic acids, opt. in combination with other alpha and/or beta subunit nucleic acids (see also T48232-38, T48240-41), express recombinant nAChR subunits useful for identifying cpds. that modulate the activity of human nAChRs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes a human neuronal nicotinic acetylcholine C receptor (NAChR) subunit. The cells expressing the alpha and/or beta CNAChR subunits may be used in a method of screening compounds to identify any which modulate the activity of human neuronal NAChR. Subunit specific antibodies may be used to monitor the distribution and expression density of various subunits in normal vs diseased brain ctissues. Testing of single receptor subunits or specific receptor subunit combinations with a variety of potential agonists or antagonists provides information with respect to the function and activity of the individual subunits and should lead to the identification and design of compounds that are capable of very specific interaction with one or unwanted side effects than drugs identified e.g. screening with cells that express a variety of subtypes.

Nucleic acid encoding variant of human alpha? nicotinic acetyl-choline receptor sub-unit - used to identify modulators of the receptor, potentially useful for treating neuro-degeneration, cancer, affective disorders etc.

Claim 14; Fig 2; 44pp; English.

This sequence encodes the V247T variant of human alpha? nicotinic acetylcholine receptor (nAChR) subbunit of the invention. Cells containing the DNA are used to express the protein and to identify modulators of alpha? nAChR activity or cytoprotective agents, e.g. antisense compounds or antagonists that are potentially useful for treating neurodegeneration, enzyme dysfunction, affective disorders and immune dysfunction, such as cancer, post-herpetic neuralgia, diabetic neuropathy, osteoarthritis, Alzheimer's or Parkinson's diseases, kuru,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-OCT-1998 (first entry)

TRESULT TO SUPPLY TO SUPPLY SU
New isolated neuronal alpha-bungarotoxin-binding protein DNA - used PT New isolated neuronal alpha-bungarotoxin-binding protein.

PT to screen cholinergic agents and other drugs which may affect ligand PT binding, ion channel or other activities of the protein.

PS Claim 1; Fig 2A-B; 18pp; English.

CC 2 CDNA clones (T59196 and T59197) respectively code for the alphal CS subunit (W12368) and alpha2 subunit (W12369) of chick neuronal CS claim 18-day embryo chick brain cDNA library using a probe (see also CC T59198) based on the N-terminal amino acid sequence of chicken CC brain AbbBP. The probe isolated partial clone pCh9-1, which can coded the N-terminal portion of alpha1. A subclone, pCh29-3 (ATCC 40641), was used to rescreen the library, yielding clone pCh31-1 (ATCC 40640), which encoded the entire alpha2 sequence.

CC A probe based on the C-terminal region of pCh31-1 was used obtain CC clone pCh34-1 (ATCC 40649), encoding the C-terminal portion of CC alpha1. The cDNA clones can be used as probes to identify further CC alpha1. The cDNA clones can be used as probes to identify further CC ABBP subunits, and in the recombinant prodn. of ABBP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          psychosis and schizophrenia. Probes based on the DNA are used to detect the DNA in usual hybridisation or amplification tests, while monoclonal antibodies are used to detect the protein for diagnosis (in vitro or by in situ immuno-fluorescent assay). Compared with wild-type alpha7 nAChR, the protein has about 100-fold greater sensitivity to cholinergic receptor agonists (nicotine or acetylcholine) and response to these agonists decays more slowly, but the wild-type inward rectification is retained.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neuronal alpha-bungarotoxin |

                                                                                                                                                                                                                                                                                                                                                                                                              brain ABBP submits, and in the recombinant product of Angle Polya (Angle Polya) and in the proble 182 A; which alphal. The proble 182 A; which encoded the N-terminal portion of alphal. A subclone, pch29-3 (ATCC 40641), was used to rescreen the library, yielding clone pch31-1 (ATCC 40640), which encoded the entire alpha2 sequence. A proble based on the C-terminal region of pch31-1 was used obtain alone pch34-1 (ATCC 40639), encoding the C-terminal portion of alpha1. The CDNA clones can be used as proble to identify further ABBP submits, and in the recombinant product of ABBP. Sequence 2101 BP; 582 A; 406 C; 454 G; 659 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          T59197 standard; cDNA; 2101 BP. Plasmid process. AFTC 67893) was isolated from a cDNA library in lambda ZAP II prepd. from rat the sequence of the cDNA in the region encoded by the 5th cexon is identical to that determined for the genomic clone with the exception of a sustn. at posn. 720 of a t for a c (this does not alter the AA sequence); this may be due to a polymorphism the rat strains used for the genomic library and the cDNA library, or could have resulted from a reverse transcriptase error during prepn. of the cDNA. A sequence, the core of which is 44 bp long is repeated three times at the beginning of the 3 UT region. The function of this remains unknown. The protein subunit can combine with the known subunits, alpha-2, 3, and -4, and beta-2 to form previously unknown unctional receptors. The new subunit is expressed in the central and peripheral nervous systems and in
                                                                                    Query Match

This invention describes a method for conferring disease resistance in plants. The invention describes the use of novel genes and proteins belonging to the Oryza longistaminata and Oryza sativa receptor cassava, maize and tomato are also described. The genes and proteins cassava, maize and tomato are also described. The genes and proteins can be used for enhancing resistance to Xanthomonas in a plant, preferably

PS Claim 56; Fig 10; 236pp; English.

CC This cDNA clone codes for a novel claimed galanin receptor subtype,

CC designated GALRZ (see W24562). It was isolated from a human heart

CC CDNA library using primers based on rat GALRZ CDNA (see T79975).

CC Also claimed are: (1) an isolated nucled acid molecule (1) encoding

CC addition in the third intracellular domain; (2) a purified GALRZ

CC protein; (3) a vector comprising (1); and (4) a cell comprising the

CC GALRZ by (claimed). GALRZ antagonists can be used to treat obesity,

CC data anorexia or pain, or to decrease nociception (claimed).

CC Aponists and antagonists can also be used to treat other disorders,

CC hypertension, convulsion/epilepsy diabetes, glaucome, reproductive

CC disorders, gastric and intestinal ulcers, inflammation, immune

CC disorders and anxiety. Antibodies can be used to detect the

CC presence of GALRZ on the surface of a cell, while transgenic

CC mammals can be used to detect the

CC varying levels of GALRZ activity (claimed).

Galanin receptor protein GalR2 and encoding polynucleotide - useful for e.g. identifying GalR2 receptor agonists or antagonists to regulate physiological responses e.g. to treat obesity and diabetes This cDNA sequence encodes a novel human galanin receptor protein, GalR2. This protein is useful for screening drugs for agonist and antagonist activity, Galanin has effects such as antinociceptive activity, smooth muscle contraction, cardiovascular activity, pituitary hormone release, cognition and increased food intake and identified drugs can regulate physiological responses associated with the GalR2 receptor, e.g.
                                                                                                                                                                                                                                              11-DEC-1997

antagonists to treat continued in the first part of obesity or cognitive disorders treatment of obesity or cognitive disorders

Example 6; Fig 7A-B; 57pp; English.

This is the DNA sequence of the human GalR2 gene that codes for a novel galanin receptor, designated GALR2 (see W61386), that is a member of the G-protein coupled receptor family. It was isolated from an EMBL3 SP6/T7 human genomic library using as probe a partigenes sequence that had been amplified from genomic DNA by PCR usi primers (see V28298-99) based on transmembrane regions of sometostatin and sometostatin-related gene receptors. The human carry game was mapped to chromosome 17q25. The invention provide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antagonists could be used to treat obesity and diabetes by reducing appetite and food consumption, or to treat Alzheimer's disease, stroke, neuropathic pain and endocrine disorders, whilst agonists could be used to treat anorexic conditions. The proteins are also useful in determining GalR2 agonist or antagonist amounts in a solution (e.g. blood plasma or serum) or to develop antibodies for determining receptor acids are useful for developing probes for determining receptor axpression levels e.g. to identify diseased or abnormal states, or antisense nucleotides to selectively inhibit expression of the receptor gene. They can also be used in gene therapy to isolate homologous sequences from other species e.g. primates, and to create transgenic mammals, e.g. knockout animals or non-human animals with native receptor replaced with the human homologue.

KOLAKOWSKI LF, Tan CP;
       novel galanin receptor, designated GALR2 (see W61402), that is a member of the G-protein coupled receptor family. It was isolated from an EMBL3 SP6/T7 human genomic library using as probe a partial gene sequence that had been amplified from genomic DNA by PCR using primers (see V45092-93) based on transmembrane regions of somatostatin and somatostatin-related gene receptors. The human GALR2 gene was mapped to chromosome 17925. The invention provides rat, human and mouse GALR2 sequences (see W61461-63). Also provided are nucleic acids encoding these novel receptor sequences and assays to identify ligands particular to murine GALR2. Such ligands may be useful therapeutically e.g. to treat obesity or cognitive disorders involving excess galanin or to treat pain or
                                                                                                                                                                                      obesity, pain or cognitive disorders
Example 6; Fig 7A-B; 56pp; English.
This is the DNA sequence of the human GALR2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                               exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rat, human and mouse GALR2 sequences (see W61385-86 and W61388). Also provided are nucleic acids encoding these novel receptors and assays to identify ligands particular to human GALR2. Such ligands may be useful therapeutically e.g. to treat obesity or cognitive disorders involving excess galanin or to treat pain or anorexia involving insufficient galanin. Nucleic acids encoding GALR2 are useful in assays for GALR2 and to produce hybridisation probes to screen for similar receptors or for GALR2 in other species. New galanin receptor, GALR2 - useful, e.g. to identify agonists and antagonists, therapeutically to treat conditions involving excess or insufficient galanin such as obesity sexample 6; Fig 7A-B; 57pp; English.

This is the DNA sequence of the human GALR2 gene that codes for a cover galanin receptor, designated GALR2 (see W49003); that is a conver galanin receptor, designated receptor family. It was isolated from an EMBL3 SP5/T7 human genomic library using as probe a partial gene sequence that had been amplified from genomic DNA by PCR using commandation of somatostatin and somatostatin-related gene receptors. The human of GALR2 gene was mapped to chromosome 17g25. The invention provides cat, human and mouse GALR2 sequences (see W49002-04). Also provided are nucleic acids encoding these novel receptor sequences can dassays to identify ligands particular to GALR2. Such ligands can useful therapeutically e.g. to treat obesity or cognitive consolving excess galanin or to treat pain or anorexia involving insufficient galanin. Nucleic acids encoding GALR2 are useful in assays for GALR2 and to produce hybridisation probes to screen for similar receptors or for GALR2 in other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

New isolated Enterococcus faecalis polynucleotides and polypeptides

- used to develop products for the detection of Enterococcus and for
use in vaccines for prevention or attenuation of Enterococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enterococcus faecalis genome contig SEQ ID NO:114. 
Enterococcus faecalis; contig; detection; Enterococ vaccine; attenuation; computer readable medium; ds. 
Enterococcus faecalis.
   Anther-specific ESJ2A ESJ2A gene; promoter; transgenic plant; ss. Arabidopsis thaliana.
                                                                                                                                                     05-JUL-1999 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cexample, expression of the RNase barnase causes cell ablation, while expression of a plant hormone alters the developmental fate cof a cell. Plants are produced that have phenotypically normal collections, within phenotypically normal anthers, but in which the anthers do not dehisce and thus do not release the pollen comparison. The system allows the female to be multiplied with the cartificial male sterility gene in the homozygous state, since the comparison of the plant produces viable pollen. The system is suited to crops which have high seed multiplication, large amounts of collen, and/or separate male and female inflorescences. These comparisons allow for easy collection of pollen from non-dehiscing conthers, facile self-pollination and the minimisation of the area cof plants that have to be self-pollinated manually. Such an collection crop is the monocot maize, but the system is also applicable to e.g. wheat, barley, rice, fodder grass, banana, palm, orchid, custeful in the avoidance or reduction of pollen allergens and compared the self-cutter of asthma caused by pollen release. isolating neuroblastic cells from a population - by detecting the expression of the Sox1 gene in the cells and sorting the cells to isolate those cells expressing Sox1 bisclosure; Page 43-44; 60pp; English.

A method has been developed for isolating neuroblastic cells from a cell population. The method comprises: (a) detecting Sox1 gene expression in the cells; and (b) isolating those cells expressing Sox1. Also described is a method for producing a cell committed to the neuronal lineage, comprising: (a) transfecting a pluripotent stem cell with a genetic construct encoding Sox1 expression; (b) culturing the stem cells to differentiate into neural cells; and (c) isolating those neural cells produced. The present sequence represents mouse Sox1 cDNA. Detection of Sox1 expressing cells is important in diagnosing and treating cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Generation of male sterile plants by controlling anther dehisce Example 1; F1g 3; 34pp; English.

Example 1; F1g 3; 34pp; English.

This is the DNA sequence of the ESJ2A gene of Arabidopsis thali

The gene was isolated from an A. thaliana genomic library using

Brassica napus SAC66 cDNA as probe. The invention relates to tuse of the ESJ2A promoter to reduce dehiscence and create male
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sterile plants for use in hybrid seed production. The promoter is used to drive expression of a further nucleic acid sequence that results in prevention or reduction of anther dehiscence. For
